Benjamin Asare Sakyi: Payment voucher lifecycle

I own the payment voucher: the model, its controller, and the state machine that moves a voucher from draft through submitted, approved and paid, or back to the preparer as returned. This is the spine of the application: every other module either feeds it or reads from it.

The decision I spent longest on was making the transitions explicit rather than letting any field be edited at any time. A voucher's status determines what may happen to it next, and that rule lives in one place rather than being re-checked in each view. Once a voucher is approved it can no longer be edited or deleted by anyone, which is what makes the record trustworthy after the fact.

The code this covers

- `app/Models/PaymentVoucher.php`
- `app/Http/Controllers/PaymentVoucherController.php`
- `app/Policies/PaymentVoucherPolicy.php`
- `tests/Feature/VoucherWorkflowTest.php`

Questions to be ready for

The examiner may ask about any part of the system, not only this one. These are the ones closest to the work described above:

- Walk through every state a voucher can be in, and what moves it between them.
- Why can an approved voucher not be edited? What would break if it could?
- Where is the rule that a preparer cannot approve their own voucher, and why there?

Before submitting, confirm this describes what you actually did. This section is assessed individually, and you may be asked to demonstrate any claim in it. Rewrite anything that does not match your own work, and add what is missing, particularly what you found difficult and what you would do differently now.
