Nicholas Mensah Ottou: General ledger and double-entry posting

I own the ledger: the chart of accounts, the posting of paid vouchers, and the reporting that reads from it.

Marking a voucher paid writes two rows, not one: a debit against the expense account and a matching credit against cash or bank. The two must sum to zero, and a test asserts that they always do. The harder problem was idempotency: posting must happen exactly once per voucher, because a repeated request would silently double the office's recorded expenditure. The posting checks for existing entries before writing, so a retry is safe.

The code this covers

- `app/Services/LedgerPoster.php`
- `app/Http/Controllers/LedgerController.php`
- `app/Http/Controllers/FinancialReportController.php`
- `tests/Feature/LedgerPostingTest.php`

Questions to be ready for

The examiner may ask about any part of the system, not only this one. These are the ones closest to the work described above:

- Show the two rows written when a voucher is paid, and explain why they balance.
- What stops a voucher being posted to the ledger twice?
- Why double-entry at all, rather than a single expenditure column?

Before submitting, confirm this describes what you actually did. This section is assessed individually, and you may be asked to demonstrate any claim in it. Rewrite anything that does not match your own work, and add what is missing, particularly what you found difficult and what you would do differently now.
