Edith Ashiagbor: Interface, usability and accessibility

I own the interface: the page layouts, the shared components, and the usability decisions behind them.

The users are clerks and accountants under time pressure, not people who enjoy software. That shaped everything: the dashboard shows where each voucher stands rather than making anyone hunt for it, errors appear beside the field that caused them as well as in a summary, and destructive actions ask for confirmation in a proper dialog rather than a browser alert.

Two decisions I would defend specifically. Active navigation is marked by weight and a rule, not colour alone, because colour alone excludes anyone who cannot distinguish it. And every colour pair was checked against the WCAG AA contrast ratio rather than judged by eye; the blue we started with failed against white text, which was not obvious until it was measured.

The code this covers

- `resources/js/layouts/`
- `resources/js/components/`
- `resources/css/app.css`

Questions to be ready for

The examiner may ask about any part of the system, not only this one. These are the ones closest to the work described above:

- Which usability heuristics did you apply, and where can you point to each in the interface?
- How does the interface know what to hide from a user, and why is that not security?
- What is the contrast requirement, and how did you verify the palette meets it?

Before submitting, confirm this describes what you actually did. This section is assessed individually, and you may be asked to demonstrate any claim in it. Rewrite anything that does not match your own work, and add what is missing, particularly what you found difficult and what you would do differently now.
